

8. Enhancing navigation with CSS

At the moment there are a number of links in a list at the top of our page. In front of the list are bullets and the items are listed one below the other. For our navigation menu, a different layout is desired. Add the code below beneath the last line of your CSS file and look at the result.

```
11
12 li {
13     display:inline;
14     margin-left:20px;
15 }
16
17 a {
18     color:#ffffff;
19     text-decoration:none;
20 }
21
22 a:hover {
23     color:#ff8800;
24 }
25
```

- When `display:inline;` is specified for an `li` in the stylesheet, this ensures that the bullet list is not displayed one item below the other but side by side. The bullets also disappear.
- The `margin-left:20px;` ensures that the items are not placed directly against one another, but that the links now keep a distance of 20 pixels.
- The colour specified for the `a` selector (applies to all anchors/links) makes all anchors/links white.
- For the same `a` selector, a `text-decoration` property has also been specified, which ensures that the standard underline beneath each link disappears.
- Finally, an `a:hover` selector has been added which ensures that when a visitor moves the mouse over the link, the link takes on a different colour (orange in this case).
